

Tutorial: Foundations of Non-truthful Mechanism Design

Part I: Equilibrium Analysis

Tutor: Jason Hartline

Schedule:

Part Ia: 10-10:45am (<http://ec20.sigecom.org/tech/tutorial>)

Part Ib: 11-11:45am (<http://ec20.sigecom.org/tech/tutorial>)

Exercises: 12-1pm (<http://ec20.sigecom.org/tech/tutorial-exercises>)
(<https://tinyurl.com/non-truthful-exercises>)

Protocol:

During session, panelest will answer clarifying questions in chat.

In post-session Q/A, “raise hand” to ask question.

EC Tutorial 2020

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Revelation principle: if exists mechanism with good equilibrium,
then exists mechanism with good truthtelling equilibrium. [Myerson '81]

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Revelation principle: if exists mechanism with good equilibrium, then exists mechanism with good truthtelling equilibrium. [Myerson '81]

Proof: truthful mechanism can simulate equilibrium strategies in non-truthful mechanism.

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Revelation principle: if exists mechanism with good equilibrium, then exists mechanism with good truthtelling equilibrium. [Myerson '81]

Proof: truthful mechanism can simulate equilibrium strategies in non-truthful mechanism.

Consequence: literature focuses on truthful mechanisms.

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Revelation principle: if exists mechanism with good equilibrium, then exists mechanism with good truthtelling equilibrium. [Myerson '81]

Proof: truthful mechanism can simulate equilibrium strategies in non-truthful mechanism.

Consequence: literature focuses on truthful mechanisms.

Issues:

- practical mechanisms are not truthful.
- not without loss for simple or prior-independent mechanisms.
- non-trivial to undo the revelation principle.

Context: The Revelation Principle

Mechanism Design: identify mechanism that has good equilibrium.

Revelation principle: if exists mechanism with good equilibrium, then exists mechanism with good truthtelling equilibrium. [Myerson '81]

Proof: truthful mechanism can simulate equilibrium strategies in non-truthful mechanism.

Consequence: literature focuses on truthful mechanisms.

Issues:

- practical mechanisms are not truthful.
- not without loss for simple or prior-independent mechanisms.
- non-trivial to undo the revelation principle.

Goal: theory for non-truthful mechanism design.

Part I

Equilibrium Analysis

- 1 Warmup: Second-price and First-Price Auction Examples
- 2 Single-dimensional Environments
- 3 Revenue Equivalence and Applications
 - Characterizing Bayes-Nash equilibrium
 - Solving for Equilibrium
 - Uniqueness of Equilibrium
- 4 Robust Analysis of Equilibria

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- ① agents bid.
- ② winner is highest bidder.
- ③ winner pays second-highest bid.

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- ① agents bid.
- ② winner is highest bidder.
- ③ winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Example (Two agents, uniform values, second-price auction)

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Example (Two agents, uniform values, second-price auction)

- Expected welfare in equilibrium:

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Example (Two agents, uniform values, second-price auction)

- Expected welfare in equilibrium: $\mathbf{E}[v_{(1)}] = 2/3$

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Example (Two agents, uniform values, second-price auction)

- Expected welfare in equilibrium: $\mathbf{E}[v_{(1)}] = 2/3$
- Expected revenue in equilibrium:

Warmup: Second-price Auction

Definition (Second-price Auction, SPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays second-highest bid.

Thm: Truthful bidding is **dominant strategy equilibrium** in SPA.

Recall: Uniform Distribution $U[0, 1]$

- **cumulative distribution function** $F(z) = z$
- **probability density function** $f(z) = 1$
- **Fact:** uniform r.v.s evenly divide their interval in expectation.
E.g., $v_1, v_2 \sim U[0, 1] \Rightarrow \mathbf{E}[v_{(1)}] = 2/3, \mathbf{E}[v_{(2)}] = 1/3$

Example (Two agents, uniform values, second-price auction)

- Expected welfare in equilibrium: $\mathbf{E}[v_{(1)}] = 2/3$
- Expected revenue in equilibrium: $\mathbf{E}[v_{(2)}] = 1/3$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

First-price Auction

Definition (First-price Auction, FPA)

- ① agents bid.
- ② winner is highest bidder.
- ③ winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

First-price Auction

Definition (First-price Auction, FPA)

- ① agents bid.
- ② winner is highest bidder.
- ③ winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

First-price Auction

Definition (First-price Auction, FPA)

- ① agents bid.
- ② winner is highest bidder.
- ③ winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\mathbf{E}[\text{utility}(v, b)] = (v - b) \times \mathbf{Pr}[1 \text{ wins with bid } b]$$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\mathbf{E}[\text{utility}(v, b)] = (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b}$$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned} \mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2 \end{aligned}$$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned} \mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2 \end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.

First-price Auction

Definition (First-price Auction, FPA)

- ① agents bid. ② winner is highest bidder. ③ winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned} \mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2 \end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned} \mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2 \end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2 \quad \Rightarrow \quad \text{“}b(v) = v/2\text{” is equilibrium.}$

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned} \mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2 \end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2 \quad \Rightarrow \quad \text{“}b(v) = v/2\text{” is equilibrium.}$
- Equilibrium welfare:

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned}\mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2\end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2 \quad \Rightarrow \quad “b(v) = v/2”$ is equilibrium.
- Equilibrium welfare: $\mathbf{E}[v_{(1)}] = 2/3$;

First-price Auction

Definition (First-price Auction, FPA)

- ① agents bid. ② winner is highest bidder. ③ winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned}\mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2\end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2 \quad \Rightarrow \quad “b(v) = v/2”$ is equilibrium.
- Equilibrium welfare: $\mathbf{E}[v_{(1)}] = 2/3$; revenue:

First-price Auction

Definition (First-price Auction, FPA)

- 1 agents bid.
- 2 winner is highest bidder.
- 3 winner pays their bid.

Qstn What are strategies? Equilibrium welfare? Equilibrium revenue?

Example (Two agents, uniform values, first-price auction)

“Guess and verify” approach:

- Guess that agent 2 bids “half of value”
- Calculate agent 1’s utility with value v and bid b :

$$\begin{aligned}\mathbf{E}[\text{utility}(v, b)] &= (v - b) \times \underbrace{\mathbf{Pr}[1 \text{ wins with bid } b]}_{\mathbf{Pr}[b_2 \leq b] = \mathbf{Pr}[v_2/2 \leq b] = \mathbf{Pr}[v_2 \leq 2b] = F(2b) = 2b} \\ &= (v - b) \times 2b = 2vb - 2b^2\end{aligned}$$

- To maximize, take derivative $\frac{d}{db}$ and set to zero, solve.
- Optimal to bid $b = v/2 \quad \Rightarrow \quad “b(v) = v/2”$ is equilibrium.
- Equilibrium welfare: $\mathbf{E}[v_{(1)}] = 2/3$; revenue: $\mathbf{E}[v_{(1)}/2] = 2/3 \cdot 1/2 = 1/3$

- **highest-bid-wins:** $\tilde{x}(\mathbf{b}) \in \operatorname{argmax}_{\mathbf{x} \in \mathcal{X}} \sum_i b_i x_i$
- **winner-pays-bid:** $\tilde{p}_i(\mathbf{b}) = b_i \tilde{x}_i(\mathbf{b})$

Incorporating Strategies and Prior Distribution

Three Stages of Mechanism Design

- **ex ante**: before values are drawn (\mathbf{v} random)

Incorporating Strategies and Prior Distribution

Three Stages of Mechanism Design

- **ex ante**: before values are drawn (\mathbf{v} random)
- **interim**: an agent's perspective at bid time (v_i known; \mathbf{v}_{-i} random)

Encorporating Strategies and Prior Distribution

Three Stages of Mechanism Design

- **ex ante**: before values are drawn (\mathbf{v} random)
- **interim**: an agent's perspective at bid time (v_i known; \mathbf{v}_{-i} random)
- **ex post**: after bids and values are known (\mathbf{v} known)

Encorporating Strategies and Prior Distribution

Three Stages of Mechanism Design

- **ex ante**: before values are drawn (\mathbf{v} random)
- **interim**: an agent's perspective at bid time (v_i known; \mathbf{v}_{-i} random)
- **ex post**: after bids and values are known (\mathbf{v} known)

Value Allocation and Payment Rules

Compose ex post mechanism (\tilde{x}, \tilde{p}) and bid strategy b :

- **ex post allocation rule**: $x(\mathbf{v}) = \tilde{x}(b(\mathbf{v}))$
- **ex post payment rule**: $p(\mathbf{v}) = \tilde{p}(b(\mathbf{v}))$

Encorporating Strategies and Prior Distribution

Three Stages of Mechanism Design

- **ex ante**: before values are drawn (\mathbf{v} random)
- **interim**: an agent's perspective at bid time (v_i known; \mathbf{v}_{-i} random)
- **ex post**: after bids and values are known (\mathbf{v} known)

Value Allocation and Payment Rules

Compose ex post mechanism (\tilde{x}, \tilde{p}) and bid strategy b :

- **ex post allocation rule**: $x(\mathbf{v}) = \tilde{x}(b(\mathbf{v}))$
- **ex post payment rule**: $p(\mathbf{v}) = \tilde{p}(b(\mathbf{v}))$

Interim Allocation and Payment Rules

Encorporating Strategies and Prior Distribution

Bayes-Nash Equilibrium

Definition (Bayes-Nash equilibrium, BNE)

A strategy profile \mathbf{b} such that for all i and v_i , bidding $b_i = b_i(v_i)$ is a best response when other agents bid $\mathbf{b}_{-i}(\mathbf{v}_{-i})$ with $\mathbf{v}_{-i} \sim \mathbf{F}_{-i}|v_i$.

Notation

- value profile w.o. agent i 's value: $\mathbf{v}_{-i} = (v_1, \dots, v_{i-1}, ?, v_{i+1}, \dots, v_n)$
- conditional distribution of \mathbf{F} given v_i : $\mathbf{F}_{-i}|v_i$ (if indep. $\mathbf{F}_{-i}|v_i = \mathbf{F}_{-i}$)

Bayes-Nash Equilibrium

Definition (Bayes-Nash equilibrium, BNE)

A strategy profile \mathbf{b} such that for all i and v_i , bidding $b_i = b_i(v_i)$ is a best response when other agents bid $\mathbf{b}_{-i}(\mathbf{v}_{-i})$ with $\mathbf{v}_{-i} \sim \mathbf{F}_{-i}|v_i$.

Example (Two agents, uniform values, first-price auction)

Strategies \mathbf{b} as “ $\forall i, b_i(v_i) = v_i/2$ ” is a Bayes-Nash equilibrium.

- values are $U[0, 1]$
- bids under \mathbf{b} are $U[0, 1/2]$
- best response to bid $U[0, 1/2]$ is $b_i(v_i) = v_i/2$

Notation

- value profile w.o. agent i 's value: $\mathbf{v}_{-i} = (v_1, \dots, v_{i-1}, ?, v_{i+1}, \dots, v_n)$
- conditional distribution of \mathbf{F} given v_i : $\mathbf{F}_{-i}|v_i$ (if indep. $\mathbf{F}_{-i}|v_i = \mathbf{F}_{-i}$)

Characterizing Bayes-Nash Equilibrium

Proposition

(\mathbf{x}, \mathbf{p}) are induced by BNE of some \mathbf{b} , \mathbf{F} , and $(\tilde{\mathbf{x}}, \tilde{\mathbf{p}})$ if and only if:

$$\forall i, v_i, z: \quad v_i x_i(v_i) - p_i(v_i) \geq v_i x_i(z) - p_i(z)$$

(and bids not in the range of \mathbf{b} are weakly dominated.)

Characterizing Bayes-Nash Equilibrium

Proposition

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

$$\forall i, v_i, z: v_i x_i(v_i) - p_i(v_i) \geq v_i x_i(z) - p_i(z)$$

(and bids not in the range of b are weakly dominated.)

Theorem (Myerson '81)

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

- a (monotonicity) x_i is monotonically non-decreasing
- b (payment identity) $p_i(v_i) = v_i x_i(v_i) - \int_0^{v_i} x_i(z) dz + p_i(0)$.

(and bids not in the range of b are weakly dominated; often $p_i(0) = 0$)

Characterizing Bayes-Nash Equilibrium

Proposition

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

$$\forall i, v_i, z: v_i x_i(v_i) - p_i(v_i) \geq v_i x_i(z) - p_i(z)$$

(and bids not in the range of b are weakly dominated.)

Theorem (Myerson '81)

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

- a (monotonicity) x_i is monotonically non-decreasing
- b (payment identity) $p_i(v_i) = v_i x_i(v_i) - \int_0^{v_i} x_i(z) dz + p_i(0)$.

(and bids not in the range of b are weakly dominated; often $p_i(0) = 0$)

Characterizing Bayes-Nash Equilibrium

Proposition

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

$$\forall i, v_i, z: v_i x_i(v_i) - p_i(v_i) \geq v_i x_i(z) - p_i(z)$$

(and bids not in the range of b are weakly dominated.)

Theorem (Myerson '81)

(x, p) are induced by BNE of some b, F , and (\tilde{x}, \tilde{p}) if and only if:

- a (monotonicity) x_i is monotonically non-decreasing
- b (payment identity) $p_i(v_i) = v_i x_i(v_i) - \int_0^{v_i} x_i(z) dz + p_i(0)$.

(and bids not in the range of b are weakly dominated; often $p_i(0) = 0$)

(and bids not in the range of b are weakly dominated; often $p_i(0) = 0$)

Cor: revenue equivalence: same BNE allocation \Rightarrow same BNE revenue.

Method of Revenue Equivalence

Cor: **revenue equivalence**: same BNE allocation \Rightarrow same BNE revenue.

Method of Revenue Equivalence

Cor: **revenue equivalence**: same BNE allocation \Rightarrow same BNE revenue.

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Method of Revenue Equivalence

Cor: **revenue equivalence**: same BNE allocation \Rightarrow same BNE revenue.

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Two examples: for i.i.d. first-price auctions

- 1 solving for symmetric Bayes-Nash equilibrium
- 2 non-existence of symmetric Bayes-Nash equilibrium

Method of Revenue Equivalence

Cor: **revenue equivalence**: same BNE allocation \Rightarrow same BNE revenue.

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Two examples: for i.i.d. first-price auctions

- 1 solving for symmetric Bayes-Nash equilibrium
- 2 non-existence of symmetric Bayes-Nash equilibrium

Consequence: BNE of FPA is unique, symmetric, and welfare-maximal.

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.
- FPA is revenue equivalent to SPA.

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.
- FPA is revenue equivalent to SPA.
- by mech. rules: $\mathbf{E}[\text{SPA payment for } v \mid v \text{ wins}] = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.
- FPA is revenue equivalent to SPA.
- by mech. rules: $\mathbf{E}[\text{SPA payment for } v \mid v \text{ wins}] = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$
- by mech. rules: $\mathbf{E}[\text{FPA payment for } v \mid v \text{ wins}] = b(v)$

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.
- FPA is revenue equivalent to SPA.
- by mech. rules: $\mathbf{E}[\text{SPA payment for } v \mid v \text{ wins}] = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$
- by mech. rules: $\mathbf{E}[\text{FPA payment for } v \mid v \text{ wins}] = b(v)$
- revenue equivalence: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Solving for Bayes-Nash Equilibrium

Method of Revenue Equivalence

Equate two equations for payments:

- a payments from mechanism rules.
- b payments from revenue equivalence.

Thm: In i.i.d. FPA, symmetric BNE is: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$

Proof.

- Guess highest-valued agent wins.
- FPA is revenue equivalent to SPA.

- by mech. rules: $\mathbf{E}[\text{FPA payment for } v \mid v \text{ wins}] = b(v)$
- revenue equivalence: $b(v) = \mathbf{E}[v_{(2)} \mid v_{(2)} < v]$
- check guess: $\mathbf{E}[v_{(2)} \mid v_{(2)} < v]$ is monotone in v

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Proof of Corollary.

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Proof of Corollary.

- agent 1 and 2 face random reserve “ $\max(b_3, \dots, b_n)$ ”

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Proof of Corollary.

- agent 1 and 2 face random reserve " $\max(b_3, \dots, b_n)$ "
- by theorem, their strategies are symmetric.

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Proof of Corollary.

- agent 1 and 2 face random reserve " $\max(b_3, \dots, b_n)$ "
- by theorem, their strategies are symmetric.
- same for player 1 and i .

Non-existence of Asymmetric BNE

Restriction for Lecture: single-item auction, continuous strategies

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium (continuous, bounded values)

Corollary

i.i.d. n -agent first-price auctions have no asymmetric equilibria.

Proof of Corollary.

- agent 1 and 2 face random reserve " $\max(b_3, \dots, b_n)$ "
- by theorem, their strategies are symmetric.
- same for player 1 and i .
- so all strategies are symmetric.

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)

② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

- assume strategies cross twice at v' and v''

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

- assume strategies cross twice at v' and v''

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

- assume strategies cross twice at v' and v''
- so by Lemma, $x_1(v) > x_2(v)$ for $v \in (v', v'')$

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

- assume strategies cross twice at v' and v''
- so by Lemma, $x_1(v) > x_2(v)$ for $v \in (v', v'')$
- so by (2): $u_1(v'') - u_1(v') = \int_{v'}^{v''} x_1(z) dz$
 $> \int_{v'}^{v''} x_2(z) dz = u_2(v'') - u_2(v')$

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof of Theorem

Revenue equivalence \Rightarrow two formulas for agent's utility:

- ① $u(v) = (v - b(v)) x(v)$ (first-price payment rule)
- ② $u(v) = \int_0^v x(z) dz$ (payment identity / revenue equivalence)

Theorem

i.i.d. 2-agent first-price auction with (unknown) random reserve has no asymmetric equilibrium
(continuous, bounded values)

Proof (by contradiction):

- assume strategies cross twice at v' and v''
- so by Lemma, $x_1(v) > x_2(v)$ for $v \in (v', v'')$
- so by (2): $u_1(v'') - u_1(v') = \int_{v'}^{v''} x_1(z) dz$
 $> \int_{v'}^{v''} x_2(z) dz = u_2(v'') - u_2(v')$
- but by Lemma and (1): $u_1(v') = u_2(v')$ and $u_1(v'') = u_2(v'')$

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof of Lemma

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof of Lemma

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof by Picture.

Proof of Lemma

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof by Picture.

Proof of Lemma

Lem: At v if $b_1(v) > b_2(v)$ then $x_1(v) > x_2(v)$, and equal if equal.

Proof by Picture.

I.i.d. winner-pays-bid position auctions

Definition (Winner-pays-bid Position Auction [cf. Edelman, Ostrovsky, Schwarz '07])

- n positions, allocation probabilities \mathbf{w} with $w_1 \geq \dots \geq w_n$,
- agents assigned to positions in order of bid,
- agents pay bid if allocated.

I.i.d. winner-pays-bid position auctions

Definition (Winner-pays-bid Position Auction [cf. Edelman, Ostrovsky, Schwarz '07])

- n positions, allocation probabilities \mathbf{w} with $w_1 \geq \dots \geq w_n$,
- agents assigned to positions in order of bid,
- agents pay bid if allocated.

Example

I.i.d. winner-pays-bid position auctions

Definition (Winner-pays-bid Position Auction [cf. Edelman, Ostrovsky, Schwarz '07])

- n positions, allocation probabilities \mathbf{w} with $w_1 \geq \dots \geq w_n$,
- agents assigned to positions in order of bid,
- agents pay bid if allocated.

Example

Theorem (Chawla, Hartline '13)

BNE of i.i.d. winner-pays-bid position auction is unique, symmetric, and welfare-optimal.

Conversion ratio of first-price auction is $\mu = 1$.

Proof.

- for any \mathbf{b}
- expected critical bids are $\hat{B}_i = \hat{b}_i = \max_{j \neq i} b_j$
- $\text{Rev}(\mathbf{b}) = \max_i b_i = \max_i \max_{j \neq i} b_j$

Analysis of Conversion Ratio

Definition (conversion ratio μ)

“high competition \Rightarrow high rev”

$$\mu = \max_{\mathbf{b}} \text{OPT}(\hat{\mathbf{B}}) / \text{Rev}(\mathbf{b})$$

Theorem

Conversion ratio of first-price auction is $\mu = 1$.

Proof.

- for any \mathbf{b}
- expected critical bids are $\hat{B}_i = \hat{b}_i = \max_{j \neq i} b_j$
- $\text{Rev}(\mathbf{b}) = \max_i b_i = \max_i \max_{j \neq i} b_j = \max_i \hat{B}_i$

Analysis of Conversion Ratio

Definition (conversion ratio μ)

“high competition \Rightarrow high rev”

$$\mu = \max_{\mathbf{b}} \text{OPT}(\hat{\mathbf{B}}) / \text{Rev}(\mathbf{b})$$

Theorem

Conversion ratio of first-price auction is $\mu = 1$.

Proof.

- for any \mathbf{b}
- expected critical bids are $\hat{B}_i = \hat{b}_i = \max_{j \neq i} b_j$
- $\text{Rev}(\mathbf{b}) = \max_i b_i = \max_i \max_{j \neq i} b_j = \max_i \hat{B}_i = \text{OPT}(\hat{\mathbf{B}})$ □

Analysis of Conversion Ratio

Definition (conversion ratio μ)

“high competition \Rightarrow high rev”

$$\mu = \max_{\mathbf{b}} \text{OPT}(\hat{\mathbf{B}}) / \text{Rev}(\mathbf{b})$$

Theorem

Conversion ratio of first-price auction is $\mu = 1$.

Proof.

- for any \mathbf{b}
- expected critical bids are $\hat{B}_i = \hat{b}_i = \max_{j \neq i} b_j$
- $\text{Rev}(\mathbf{b}) = \max_i b_i = \max_i \max_{j \neq i} b_j = \max_i \hat{B}_i = \text{OPT}(\hat{\mathbf{B}})$ □

Properties of Conversion Ratio

- not an equilibrium property.
- closed under simultaneous composition.
- tight in some environments.
- closed under randomization.

Example: Single-minded Combinatorial Auctions

Theorem (e.g., Lucier, Borodin '10)

winner-pays-bid highest-bids-win mechanisms can have very bad equilibria.

Example: Single-minded Combinatorial Auctions

Theorem (e.g., Lucier, Borodin '10)

winner-pays-bid highest-bids-win mechanisms can have very bad equilibria.

Example (Single-minded Combinatorial Auction)

Preferences:

- m items; $m + 2$ agents.
- agent $i \in \{1, \dots, m\}$ values bundle $S_i = \{i\}$ at $v_i = 1$.
- agent $h \in \{m + 1, m + 2\}$ values bundle $S_h = \{1, \dots, m\}$ at $v_h = 1$.

Example: Single-minded Combinatorial Auctions

Theorem (e.g., Lucier, Borodin '10)

winner-pays-bid highest-bids-win mechanisms can have very bad equilibria.

Conversation ratio is $\mu = m$:

$$\hat{B}_i = 1; \hat{B}_h = 1; \text{OPT}(\hat{\mathbf{B}}) = m; \text{Rev}(\mathbf{b}) = 1.$$

Greedy Single-minded Combinatorial Auction

Definition (Greedy Winner-pays-bid Mechanism)

① bidders bid, ② allocate greedily by $\phi_i(b_i)$, ③ winners pay their bids.

Greedy Single-minded Combinatorial Auction

Definition (Greedy Winner-pays-bid Mechanism)

① bidders bid, ② allocate greedily by $\phi_i(b_i)$, ③ winners pay their bids.

Theorem (Hartline, Hoy, Taggart '14)

Conversion ratio μ of greedy winner-pays-bid mechanism equals approximation ratio β of greedy algorithm.

Greedy Single-minded Combinatorial Auction

Definition (Greedy Winner-pays-bid Mechanism)

① bidders bid, ② allocate greedily by $\phi_i(b_i)$, ③ winners pay their bids.

Theorem (Hartline, Hoy, Taggart '14)

Conversion ratio μ of greedy winner-pays-bid mechanism equals approximation ratio β of greedy algorithm.

Theorem (Lehmann, O'Callaghan, Shoham '02)

Greedy by $b_i/\sqrt{|S_i|}$ winner-pays-bid algorithm is $\beta = \sqrt{m}$ approximation.

Greedy Single-minded Combinatorial Auction

Definition (Greedy Winner-pays-bid Mechanism)

① bidders bid, ② allocate greedily by $\phi_i(b_i)$, ③ winners pay their bids.

Theorem (Hartline, Hoy, Taggart '14)

Conversion ratio μ of greedy winner-pays-bid mechanism equals approximation ratio β of greedy algorithm.

Theorem (Lehmann, O'Callaghan, Shoham '02)

Greedy by $b_i/\sqrt{|S_i|}$ winner-pays-bid algorithm is $\beta = \sqrt{m}$ approximation.

Corollary (cf. Borodin, Lucier '10)

The BNE welfare of the greedy winner-pays-bid mechanism is $\sqrt{m}e/e - 1$.
